

- 1) The goal of this website is to provide users with a central place to find information on movies and t.v. shows as well as curate a personal experience like creating a watchlist or compiling their favorite films.
- 2) People trying to find more specific information about a movie, or those trying to search for a new film to view.
- 3) I will be using data from the Omdb API, which gives varying data on a large number of films and shows.
- 4) I will need a database for users/login information. A table for favorited movies or shows, as well as a watch list etc.
  - a) The api's search feature might not be robust enough to handle all of a user's queries. I will have to handle failed searches in this case.
  - b) User's login info is sensitive and will have to be handled securely.
  - c) The ability to favorite movies, create a watchlist and check already watched films are some of the functionality the site will provide, along with the basic functionality of being able to click on a title for more information.
  - d) A user flow might be asking for login, taking to the main page to search or browse titles, choosing to favorite something or add it to watch later, then logout.
  - e) Being able to login and curate a watchlist goes beyond CRUD, as long as some of the other features.
